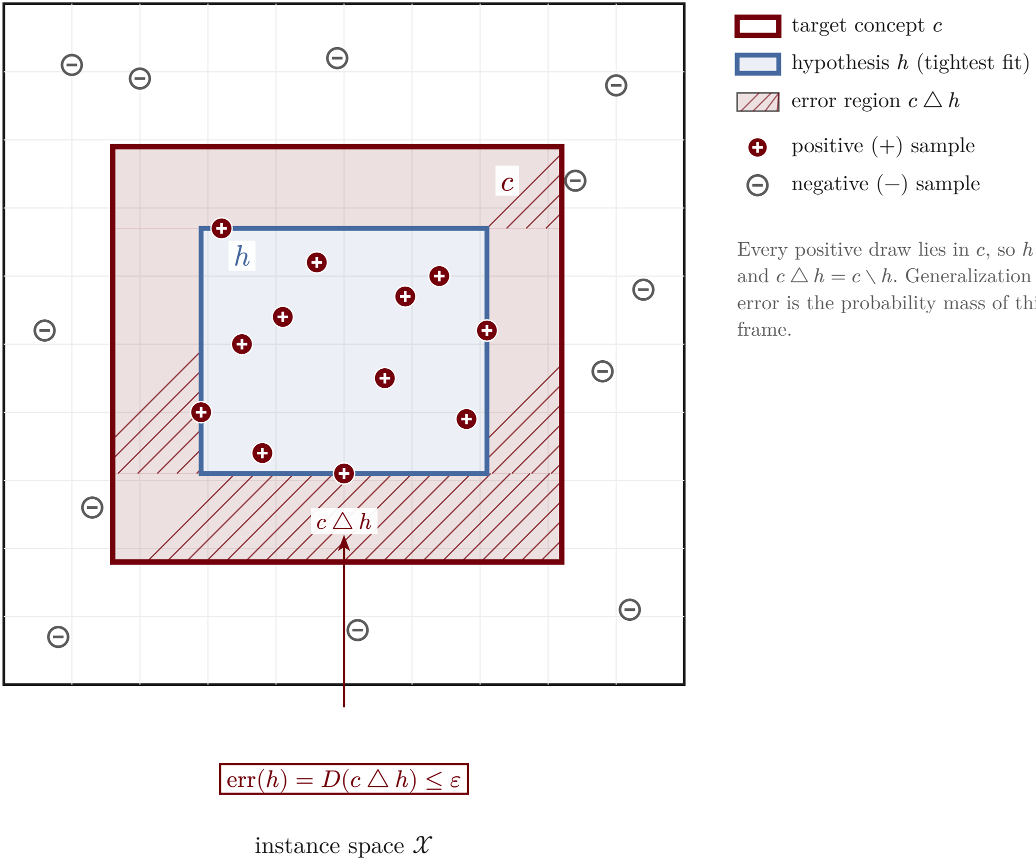
PAC learning: target c, hypothesis h, error region

$$\Pr_{S\sim D^m}[\,\mathrm{err}(h) \le \varepsilon\,] \ge 1-\delta \quad \text{when} \quad m \ge \left(\tfrac{4}{\varepsilon}\right)\ln\left(\tfrac{4}{\delta}\right)$$



Every positive draw lies in c, so $h \subseteq c$ and $c \triangle h = c \setminus h$. Generalization error is the probability mass of this frame.
