

Linear-chain conditional random field

undirected, discriminative: models $p(y \mid x)$ — observations are given, not generated

$$p(y \mid x) = \frac{1}{Z(x)} \prod_t \varphi_t(y_t, x) \prod_t \psi_t(y_{t-1}, y_t)$$

○ label node y_t (modelled) ◼ observation x_t (conditioned on)

— undirected potential (no arrowheads) — focal pairwise term
