

Fast Fourier Convolution layer

local + global channels; a Fourier global branch gives an image-wide receptive field in one layer

$$Y_l = f_{l \rightarrow l}(X_l) + f_{g \rightarrow l}(X_g)$$

$$Y_g = f_{g \rightarrow g}(X_g) + f_{l \rightarrow g}(X_l)$$

Spectral Transform $f_{g \rightarrow g}$ — the image-wide receptive field
